RECRUITMENT FUNNEL ANALYSIS

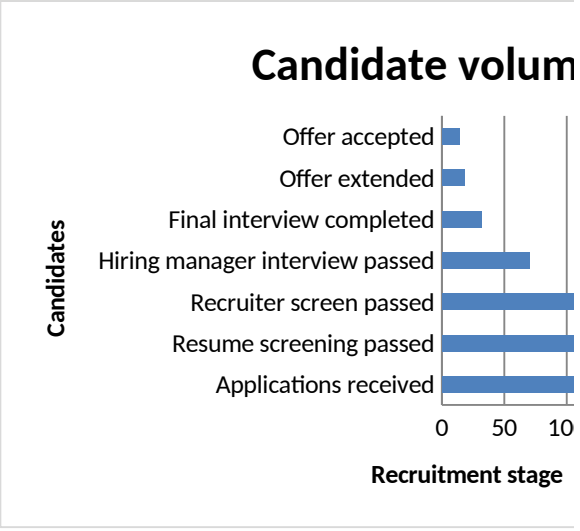

Self-initiated portfolio project | All candidate counts are synthetic and illustrative

APPLICANTS	OFFERS ACCEPTED	OVERALL CONVERSION	LARGEST STAGE DROP-OFF
240	14	5.8%	70

How to read this dashboard

Stage conversion compares candidates in a stage with the previous stage. Overall conversion compares accepted offers with the initial applicant pool. Drop-off is a signal to investigate, not proof of a process failure.

Stage	Candidates	Drop-off	Stage conversion	Cumulative conversion
Applications received	240	0	100.0%	100.0%
Resume screening passed	180	60	75.0%	75.0%
Recruiter screen passed	110	70	61.1%	45.8%
Hiring manager interview passed	70	40	63.6%	29.2%
Final interview completed	32	38	45.7%	13.3%
Offer extended	18	14	56.3%	7.5%
Offer accepted	14	4	77.8%	5.8%

Recruitment Funnel — Stage Data

Synthetic counts for demonstration only; not real hiring data.

Stage order	Stage	Candidates	Drop-off from previous	Stage conversion	Cumulative conversion	Question to investigate
1	Applications received	240	0	100.0%	100.0%	Starting pool; confirm cohort/time window
2	Resume screening passed	180	60	75.0%	75.0%	Review screening criteria and role requirements
3	Recruiter screen passed	110	70	61.1%	45.8%	Review scheduling, candidate expectations and role alignment
4	Hiring manager interview passed	70	40	63.6%	29.2%	Review interview turnaround and evaluation consistency
5	Final interview completed	32	38	45.7%	13.3%	Review panel availability and process length
6	Offer extended	18	14	56.3%	7.5%	Review decision approvals and offer timelines
7	Offer accepted	14	4	77.8%	5.8%	Capture decline reasons where voluntarily provided

Cohort assumpt This simplified exercise treats the stage counts as one sequential cohort. Real recruiting data can include parallel stages, re-entry, withdrawals, multiple roles and different reporting windows.

Interpretation, limitations and next steps

Topic	Portfolio finding / guidance
Project type	Self-initiated case study using synthetic stage-level counts.
Illustrative observation 1	The largest absolute drop-off is 70 candidates between resume screening passed (180) and recruiter screen passed (110). This identifies a stage to investigate, not a cause.
Illustrative observation 2	The overall application-to-acceptance conversion is 14 / 240 = 5.8% for this simplified sequential funnel.
Illustrative observation 3	18 offers extended and 14 accepted gives a 77.8% offer acceptance rate within this illustrative dataset.
Definitions	Stage conversion = current-stage candidates ÷ previous-stage candidates. Cumulative conversion = current-stage candidates ÷ initial applicants. Drop-off = previous-stage count − current-stage count.
Interpretation guardrail	Counts alone do not explain why candidates leave. Validate stage definitions, cohort windows, role mix, withdrawals, source channel, time-in-stage and data quality before drawing conclusions.
Recommendation 1	Track time-in-stage alongside conversion to distinguish possible scheduling friction from candidate decisions.
Recommendation 2	Capture standardised withdrawal and offer-decline reasons only when appropriate, with clear privacy controls and voluntary feedback where possible.
Recommendation 3	Use consistent screening and interview criteria; compare roles or sources only when definitions and sample sizes are appropriate.
Next iteration	Add row-level synthetic records with role family, source channel, stage dates and outcome reason; build PivotTables and segmented views.

Field	Type	Definition
Stage order	Integer	Sequential order used in this simplified example.
Stage	Text	Recruitment stage label; stage definitions should be agreed before analysis.
Candidates	Integer	Synthetic count entering or completing the stated stage.
Drop-off from previous	Integer	Prior stage count minus current stage count.
Stage conversion	Percentage	Current stage count divided by previous stage count.
Cumulative conversion	Percentage	Current stage count divided by initial applicant count.
Question to investigate	Text	A hypothesis prompt for further review; not a proven explanation.
